Window Dressing

Abstract: a 6 mil thick 42" wide weather resistant sheeting that is stapled or glued on top of the boards that are used to seal a building when vacancy, fire or condemnation occurs.

Once this window grid like sheeting is applied to all boards, the building will then have the false look of windows, removing the ugly sight and vacant look.

There are 1/2" thick white lines spaced evenly throughout the roll of sheeting over top of a black background. This grid duplicated the look of small window panes or muttons of a window.
